

// UNIVERSITY ASSIGNMENT • 2026

Portfolio Website Documentation.

Design, development process, AI-use record, deployment instructions, and testing checklist.

STUDENT	Nitin Poonia
ROLL NUMBER	590025708
COURSE	B.Tech CSE (Core)
SEMESTER	3
DATE	5 September 2026

BUILT WITH HTML5 • CSS3 • VANILLA JAVASCRIPT

Portfolio Website Documentation

1. Student Details

Field	Details
Name	Nitin Poonia
Roll number	590025708
Course	B.Tech CSE (Core)
Semester	Semester 3
Documentation date	5 September 2026
Repository	https://github.com/nitinpoonias123/portfolio
Expected live website	https://nitinpoonias123.github.io/portfolio/

The live URL must be checked after GitHub Pages deployment. This document does not claim that deployment has already succeeded.

2. Starting Point and Template

The portfolio was built from scratch with semantic HTML5, custom CSS3, and vanilla JavaScript. No premade portfolio template, framework, or component library was used. A user-supplied example informed the broad editorial direction: warm paper texture, serif display typography, restrained red accents, simple borders, and handwritten-style details. The final structure, styling, content, components, responsive layouts, dark theme, and interactions were created specifically for this portfolio.

The site uses only local project files and relative paths, so it can run by opening `index.html` and can be published directly with GitHub Pages.

3. AI Tools Used

- **ChatGPT:** Used to read the assignment PDF, turn its rubric into a complete implementation brief, organize Nitin's supplied details, and identify missing or inconsistent requirements.
- **OpenAI Codex in ChatGPT:** Used to create the HTML, CSS, JavaScript, SVG image fallback, documentation, and README, and to perform local structural, syntax, and file-serving checks.
- **Claude:** A Claude-ready prompt was prepared during planning, but Claude was not used to generate the final implementation contained in this repository.

Nitin supplied the personal information, portrait, biographies, skills, and genuine GitHub project links. AI assistance was used as a development tool, and the output should be reviewed and understood by the student before submission.

4. Exact AI Prompts Used

The direct instruction used to begin the final Codex implementation was:

"use this prompt and make a welldesigned website for my protfolio"

The detailed development prompt supplied with that instruction is preserved verbatim in [cclaude-prompt.md](#). That file is part of this repository so the original spelling, requirements, personal details, and constraints remain unchanged. During implementation, the one contradictory reference to "Semester 5" was corrected to Semester 3 to match the

student's latest information.

Earlier prompt-planning instruction:

"Make a prompt for this assignment to upload to claude to make the website as mentioned in the file"

5. Method and Approach

- Read the assignment and converted every required section and rubric item into a checklist.
- Organized the supplied personal details, contact links, skills, portrait, and GitHub repositories.
- Planned a semantic single-page structure: navigation, hero, About, Skills, Projects, Contact, and footer.
- Built `index.html` with meaningful landmarks, a logical heading hierarchy, labels, alternative text, and keyboard-accessible controls.
- Designed a mobile-first visual system in `style.css` using CSS variables, responsive grids, a warm paper/red/green editorial palette, subtle athlete-inspired details, and light/dark themes.
- Added vanilla JavaScript for navigation, theme persistence, active links, reduced-motion-aware reveals, photo fallback, form validation, `mailto:` composition, and the current year.
- Added three honest project cards: 100 Days of C Programming, 100 Days of DSA, and this portfolio.
- Added the downloadable documentation link in the footer and checked that it points to the real repository-root file.
- Checked JavaScript syntax, file paths, internal section targets, required content, and local HTTP responses. Visual layout and keyboard behavior are included in the final manual browser checklist below.
- Prepared the project for upload to a public GitHub repository and GitHub Pages deployment.

6. Project Structure

```
portfolio/  
■■■ index.html Main semantic webpage  
■■■ style.css Design system and responsive layouts  
■■■ script.js Accessible interactions and form behavior  
■■■ preview.html Self-contained preview with embedded CSS, JS, and portrait  
■■■ documentation.md This assignment documentation  
■■■ documentation.pdf Formatted downloadable documentation  
■■■ claude-prompt.md Full original detailed AI prompt  
■■■ README.md Usage, customization, and deployment guide  
■■■ assets/  
■■■ profile.jpg Nitin's supplied portrait  
■■■ profile-placeholder.svg Initials fallback if the portrait fails
```

7. Main Features

- Responsive editorial-style layout for phone, tablet, and desktop screens.
- Warm paper-textured light theme plus a high-contrast dark theme.
- Sticky navigation with mobile menu, Escape-key support, and active-section highlighting.
- Light and dark themes saved in `localStorage`.
- Real portrait with an automatic “NP” fallback image.
- Three project cards with safe external GitHub links.
- Accessible contact form that validates input and opens the visitor's email application.
- Reduced-motion support, visible focus states, semantic landmarks, and a skip link.
- Working footer link for downloading the formatted PDF documentation.

8. Running Locally

The simplest method is to open `index.html` in a browser. A local server more closely matches GitHub Pages behavior:

```
cd portfolio
python -m http.server 8000
```

Then open <http://localhost:8000>.

9. GitHub Pages Deployment

- Open the public repository at <https://github.com/nitinpoonnia123/portfolio> or create it if it does not exist.
- Put every project file in the repository root, keeping the `assets` folder structure unchanged.
- Confirm that the main page is named exactly `index.html`.
- Commit and push the files to the main branch.
- In GitHub, open **Settings** → **Pages**.
- Under **Build and deployment**, select **Deploy from a branch**.
- Select the main branch and `/ (root)` folder, then save.
- Wait for GitHub Pages to publish the site.
- Open <https://nitinpoonnia123.github.io/portfolio/> and verify the complete site.

Example Git commands:

```
git init
git add .
git commit -m "Build personal portfolio website"
git branch -M main
git remote add origin https://github.com/nitinpoonnia123/portfolio.git
git push -u origin main
```

If the repository already contains Git history or a remote, do not repeat `git init` or `git remote add`. Review the existing setup first.

10. Testing Checklist

Before submission, manually confirm each item on the published site:

- ■ Desktop layout works at approximately 1024px and 1440px.
- ■ Mobile layout works at approximately 320px and 375px without horizontal scrolling.
- ■ Tablet layout works at approximately 768px.
- ■ All navigation links move to the correct sections.
- ■ Mobile navigation opens, closes, and responds to the Escape key.
- ■ Light/dark theme selection remains after refreshing.
- ■ All three GitHub project links open correctly.
- ■ Both email links and both social links are correct.
- ■ Contact form validation works and opens an email draft.
- ■ Keyboard navigation and visible focus indicators work.
- ■ The portrait loads and the initials fallback works if its path is temporarily changed.
- ■ “Download Documentation PDF” downloads `documentation.pdf`.
- ■ Browser developer tools show no console errors.
- ■ The repository is public and the GitHub Pages URL opens correctly.

11. Submission Items

Submit all three required items only after verifying them:

- Live website URL: <https://nitinponia123.github.io/portfolio/>
- Public repository URL: <https://github.com/nitinponia123/portfolio>
- Documentation file: `documentation.pdf`

Appendix A — Exact Detailed AI Prompt

The full prompt is reproduced verbatim below. The final build corrected the isolated Semester 5 inconsistency to Semester 3.

Act as an expert front-end developer and UI/UX designer. Build a polished, original personal portfolio website for me that fully satisfies my university assignment.

Do not merely explain the process or provide a plan. Create the complete, runnable project with every required file and all code.

My personal information

- Full name: Nitin Poonia
- Professional title: Computer Science Student
- Roll number: 590025708
- Course: B.Tech CSE (Core)
- Batch/semester: Semester 3
- Documentation date: 5 September 2026
- Personal email: [devisaroj30302@gmail.com](mailto\:devisaroj30302@gmail.com)
- Student email: [nitin.25708@stu.upes.ac.in](mailto\:nitin.25708@stu.upes.ac.in)
- GitHub: <https://github.com/nitinpoonია123>
- LinkedIn: [<https://www.linkedin.com/in/nitin-poonia-3a269b376/>](https://www.linkedin.com/in/nitin-poonia-3a269b376/)
- Repository: <https://github.com/nitinpoonია123/portfolio>
- Expected live website: [<https://nitinpoonია123.github.io/portfolio/>](https://nitinpoonია123.github.io/portfolio/)

Use my student email as the main contact address and show my personal email as an alternative.

Biography

Rewrite the following naturally in the first person for the About section while retaining the facts and avoiding exaggerated or generic AI language:

"Nitin is a focused B.Tech student and high-performing athlete who blends technical problem-solving with competitive drive. Standing 6'6", he brings strong leadership and a commanding presence to engineering projects and the basketball court. Coming from a business family, Nitin possesses an entrepreneurial mindset, pairing strong self-confidence with a relentless work ethic to drive impactful results."

Keep the biography professional, authentic, and concise.

Skills

Display these skills attractively:

- C Programming
- Data Structures and Algorithms
- HTML5
- CSS3
- JavaScript
- Python
- Problem Solving
- Leadership
- Teamwork

Do not add proficiency percentages or falsely claim expert-level ability.

Profile photograph

I have uploaded my photograph with this prompt.

- Use it as the profile image.
- Save or reference it as `assets/profile.jpg`.
- Crop it appropriately using CSS so that it displays professionally without distorting the image.
- Use `object-fit: cover` and sensible positioning.
- Add meaningful alternative text: "Portrait of Nitin Poonia."
- Also create `assets/profile-placeholder.svg` containing a polished "NP" initials design.
- If `profile.jpg` cannot load, automatically replace it with the SVG fallback.

Projects

Create at least three project cards using these genuine projects:

Project 1: 100 Days of C Programming

- Description: A consistent coding-practice repository documenting solutions and exercises completed during a 100-day C programming challenge.
- Technologies: C, Problem Solving, Git, GitHub
- Link: <https://github.com/nitinpoonია123/100daysofcode>

Project 2: 100 Days of DSA

- Description: A collection of data structures and algorithms practice solutions created to strengthen logical thinking and

coding fundamentals.

- Technologies: C, Data Structures, Algorithms, GitHub
- Link: <https://github.com/nitinpoonial23/100-DAYS-DSA-CODES>

Project 3: Personal Portfolio Website

- Description: A responsive personal portfolio designed to present my background, technical skills, coding practice, and contact details.
- Technologies: HTML5, CSS3, JavaScript, Responsive Design
- Link: <https://github.com/nitinpoonial23/portfolio>

Do not invent completed projects, achievements, certifications, employment, or technical experience.

Technical requirements

- Use only HTML5, CSS3, and vanilla JavaScript.
- Do not use React, TypeScript, Tailwind, Bootstrap, npm, build tools, or a backend.
- The website must work by opening `index.html`.
- It must deploy directly to GitHub Pages.
- Use relative paths so it works inside the `/portfolio/` repository path.
- Do not require API keys.
- Keep the code organized, readable, and suitable for a university student to explain.
- Add useful comments without over-commenting obvious code.
- Create an original design instead of copying an existing template.
- Do not use Lorem Ipsum or fabricated information.

Required project structure

Create this complete structure:

```
``text
portfolio/
  index.html
  style.css
  script.js
  documentation.md
  README.md
  assets/
  profile.jpg
  profile-placeholder.svg
...
```

If you cannot create files directly, provide the complete contents of every file in separate, clearly labelled code blocks. Do not shorten code with phrases such as "continue similarly" or "code omitted."

Required website sections

1. Header and navigation

- Display "Nitin Poonia" or an elegant "NP" text logo.
- Include navigation links for Home, About, Skills, Projects, and Contact.
- Make the header sticky while scrolling.
- Add an accessible mobile hamburger menu.
- Close the mobile menu when a link is selected or Escape is pressed.
- Indicate the currently visible section.
- Include an accessible light/dark theme button.

2. Hero section

- Introduce me as Nitin Poonia, a Computer Science Student.
- Write a concise supporting line connecting technology, problem-solving, basketball, leadership, and continuous learning.
- Add a "View My Projects" button that scrolls to Projects.
- Add a "Contact Me" button that scrolls to Contact.
- Use tasteful CSS decoration rather than unrelated stock images.
- Keep the presentation professional and suitable for academic evaluation.

3. About Me

- Include the rewritten first-person biography.
- Show my uploaded photograph prominently.
- Mention my B.Tech CSE (Core) studies, coding practice, interest in problem-solving, basketball background, leadership, and entrepreneurial mindset.
- Avoid unsupported claims or exaggerated language.

4. Skills

- Present all listed technical and personal skills using polished cards or badges.
- Group them into Technical Skills and Personal Strengths.
- Do not use fake progress percentages.

5. Projects

- Include all three specified project cards.

- Each card must contain a title, description, technologies, and repository link.
- Label the links clearly, such as "View on GitHub."
- Open external links safely in a new tab using `target="\_blank"` and `rel="noopener noreferrer"`.
- Use inline SVG icons if icons are required.

6. Contact

- Display both email addresses.
- Include working GitHub and LinkedIn links.
- Add an accessible contact form containing name, email, and message fields.
- Since the site has no backend, validate the fields with JavaScript and then open a correctly encoded `mailto:` link addressed to `nitin.25708@stu.upes.ac.in`.
- Clearly explain that submitting the form opens the visitor's email application.
- Show understandable validation and status messages.
- Do not falsely claim that messages are stored or sent through a server.

7. Footer

- Include Nitin Poonia's name and a copyright year generated with JavaScript.
- Include a prominent working button with this exact structure:

```
``html
<a href="documentation.md" download class="download-btn">
Download Documentation
</a>

...

```

- Ensure the button downloads the actual `documentation.md` file on GitHub Pages.

Visual design

Create a distinctive, modern design inspired by technology, discipline, and competitive sport without making it look like a sports-only website.

- Use a sophisticated dark navy or charcoal base with an energetic blue, cyan, or electric-orange accent.
- Use strong typography, clear visual hierarchy, generous spacing, restrained gradients, and soft shadows.
- Add a subtle basketball-inspired circular pattern or court-line motif using CSS only.
- Avoid excessive glowing effects, clutter, emoji icons, and generic AI-generated slogans.
- Use CSS variables for colors, spacing, typography, shadows, and transitions.
- Add refined hover effects and subtle section-reveal animations.
- Respect `prefers-reduced-motion`.
- Include light and dark modes with good contrast.
- Save the selected theme in `localStorage`.
- Use system fonts or a reliable web-font fallback so the site remains usable if an external font fails.

Responsive design

Use a mobile-first approach and ensure the site works correctly at approximately:

- 320px
- 375px
- 768px
- 1024px
- 1440px

Requirements:

- No horizontal overflow.
- Readable text without zooming.
- Responsive navigation, project cards, skills, photograph, buttons, and form.
- Touch-friendly controls.
- Hero content should stack cleanly on phones.
- Project cards should change from one column on mobile to multiple columns on larger screens.
- The image must remain well cropped and must not become distorted.

Accessibility

- Use semantic HTML5 elements.
- Include a logical heading hierarchy.
- Add a visible "Skip to main content" link.
- Provide meaningful image alt text.
- Ensure every form input has a label.
- Add ARIA attributes only where they improve accessibility.
- Make all interactive elements keyboard accessible.
- Use visible focus styles.
- Maintain sufficient color contrast.
- Respect reduced-motion settings.

JavaScript features

Implement:

- Accessible mobile navigation.

- Escape-key support for closing the menu.
 - Smooth internal scrolling, disabled when reduced motion is preferred.
 - Active navigation highlighting.
 - Light/dark theme switching with saved preference.
 - Reveal-on-scroll effects with a fallback for older browsers.
 - Contact-form validation and encoded `mailto:` submission.
 - Dynamic copyright year.
 - Automatic fallback if `assets/profile.jpg` fails to load.
- No console errors.

The core content and navigation must remain usable if JavaScript is disabled.

Documentation file

Create a complete `documentation.md` containing:

1. Student details:
 - Nitin Poonia
 - Roll number 590025708
 - B.Tech CSE (Core), Semester 5
 - 5 September 2026
2. Starting point:
 - Built from scratch using HTML5, CSS3, and vanilla JavaScript.
 - Claude was used as an AI-assisted starting point.
 - No premade portfolio template was copied.
3. AI tools:
 - ChatGPT was used to examine the assignment and prepare the detailed development prompt.
 - Claude was used to generate the initial website structure, UI, CSS, JavaScript, documentation, and README.
 - State that the student reviewed, customized, and tested the output.
4. Exact prompts:
 - Include this entire prompt verbatim in a section called "Exact AI Prompt Used."
 - If automatically reproducing the entire prompt is not possible, add a very prominent marker stating:
`[PASTE THE COMPLETE CLAUDE PROMPT HERE BEFORE SUBMISSION]`
 - Never falsely say the full prompt is included when it is not.
5. Method:
 - Explain the process step by step: reviewing requirements, planning sections, creating semantic HTML, designing responsive CSS, adding JavaScript interactions, inserting personal information and project links, creating documentation, testing, and deploying.
6. Project structure and purpose of every file.
7. Local preview instructions.
8. GitHub Pages deployment instructions.
9. Links:
 - Repository: <https://github.com/nitinpoonias123/portfolio>
 - Expected live site: <https://nitinpoonias123.github.io/portfolio/>
 - Clearly state that the live URL must be verified after deployment.
10. Testing checklist:
 - Desktop layout
 - Mobile layout
 - Navigation
 - Theme switch
 - Project links
 - Contact form
 - Keyboard navigation
 - Image fallback
 - Documentation download
 - GitHub Pages live URL

The documentation must be honest. Do not state that deployment or testing has been completed unless it has actually been performed.

README file

Create a helpful `README.md` containing:

- Project title and overview.
- Features.
- Technologies used.
- Project structure.
- Local preview instructions.
- How to replace the profile photograph.
- How to customize personal details and projects.
- Repository and expected live-site links.
- GitHub Pages deployment steps:
 1. Create or open the public `portfolio` repository.
 2. Place `index.html` at the repository root.
 3. Upload or push every project file.
 4. Open repository Settings → Pages.
 5. Select "Deploy from a branch."
 6. Select the `main` branch and `/ (root)` folder.
 7. Save and wait for deployment.
 8. Open and test the generated URL.
- A reminder to verify all links and the documentation download before submitting.

Final quality checks

Before finishing, inspect the complete project and confirm:

- All required assignment sections are present.
- The website contains at least three honest project cards.
- Navigation links point to valid section IDs.
- Stylesheet, script, image, and documentation paths are correct and case-sensitive.
- The portrait has a working initials fallback.
- The download button points to `documentation.md`.
- The download filename exists in the repository root.
- Both GitHub project links are written correctly.
- The contact form explains its `mailto:` behavior.
- No personal facts were invented.
- No Lorem Ipsum remains.
- No button is decorative or misleading.
- There are no missing closing tags or obvious JavaScript errors.
- The website is responsive and accessible.
- It is ready for GitHub Pages.

After creating the complete files, give me:

1. A short summary of the website.
2. The final project tree.
3. Any actions or placeholders still requiring my attention.
4. Exact instructions to preview it locally.
5. Exact commands or steps to upload it to GitHub and enable GitHub Pages.

Do not stop after presenting a plan. Generate the complete website now.
